1. Executive summary

Indians already use voice in **WhatsApp**, **Google Assistant**, and voice search. On **ChatGPT mobile**, the blocker for working professionals is not “where is the mic?” — most have tried voice. The blocker is **control**: the transcript can feel committed before they read and fix it.

Focus segment: working professionals in India on ChatGPT mobile (daily use, high-stakes work prompts, subscription upside).

Research signal (directional, n=10 in segment): 70% say typing feels safer; 50% want check-and-fix before send; 80% use voice on WhatsApp; none rated ChatGPT voice above Google/Gemini.

Solution chosen: Voice Draft Mode — speech lands in an editable draft; nothing sends until the user taps Send. Prototype: [Figma Make site](#).

North-star metric: voice prompt completion rate (mic session → Send), with edit rate and 7-day repeat as supporting metrics.

2. Milestone 1 — Market research

Full presentation: [ChatGPT Voice Adaption amongst Indian Audience.pdf](#)

Landscape (India)

- Mobile-first internet; voice is a normal input channel.
- English often used for work; Hindi/regional for social — recognition matters long-term, but voice habit already exists elsewhere.
- ChatGPT mobile competes with **Gemini Live** on conversational feel.

Initial segments

1. Non-English / vernacular-first users
2. Tier-2 & Tier-3 mobile-first users
3. WhatsApp voice-note natives
4. Students & young learners
5. Metro English-first professionals → deep dive in Milestone 2

Competitive UX patterns

Product	Pattern
WhatsApp	Record → listen → send or re-record
Gemini Live	Interrupt and correct mid-stream
Google Assistant	Short commands; less long-form prompting
ChatGPT mobile	Mic → transcript → feels immediate

Metrics explored

Weekly Successful Voice Users (WSVU), discovery rate, voice start rate, task success, repeat usage.

Sources (public): Reuters, DataReportal, Google for India, Google–KPMG Indian Languages, IMAI–Kantar, ASER, OpenAI Help Center, Exchange4Media — see Milestone 1 PDF for citations.

3. Milestone 2 — User research & problem framing

Standalone deck PDF: [Milestone2 User Research Deck.pdf](#)

SLIDE 1

Chosen segment — working professionals (ChatGPT mobile, India)

Segment	Why not lead
Students	Lower WTP; mixed language on first trust
Job seekers	Spiky usage
Content creators	Smaller mobile DAU share
Regional-language-first	ASR investment; not 2-week fix
Working professionals ✓	Daily use, work stakes, Plus fit

Impact: High-stakes prompts; if voice is safe, session length and repeat use move for a high-LTV cohort.

SLIDE 2

Insights — quantitative & qualitative

Methods: Survey n=16 (10 in segment); 3 follow-up interviews + open-text; target 30+ for production validation.

70%

Typing feels safer

50%

Check-and-fix would help

80%

Voice on WhatsApp

Hypotheses tested: Discoverability (weak) · Control (strong) · Accent (mixed) · Privacy (moderate) · Habit (strong).

- Commit anxiety — wrong word becomes the prompt before fix.
- WhatsApp mental model: listen before send; ChatGPT feels send-first.
- Gemini: interrupt mid-sentence; ChatGPT composer feels one-shot.

Detail: [docs/survey-and-interviews.md](#)

SLIDE 3

Problem Framing Canvas

Field	Answer
User / context	Working professional, mobile, commute / between meetings
Current behaviour	Types important prompts; tried voice, reverted
Desired behaviour	Speak when busy — if as safe as typing
Barrier	Cannot verify/fix transcript before it becomes the prompt
Competitive reference	WhatsApp review; Gemini interrupt
Problem statement	Voice underused not because hidden — because first transcript is not trusted
Direction	Voice Draft Mode

Full canvas: <docs/problem-framing-canvas.md>

4. Milestone 3 — Prioritisation, metrics & growth

Standalone 3-pager PDF: [Milestone3 VoiceDraftMode 3Pager.pdf](#)

Three directions & trade-offs

Direction	Impact	Effort (2 wk)	Decision
A. Voice Draft Mode	High — adds review	Medium	Build
B. Auto-organize / STAR guide	Medium	Medium-high	Later
C. Recognition / Hinglish	High long-term	Very high	Out

User flow

- 1 Mic visible in composer.
- 2 Tap mic → speak → stop.
- 3 Transcript in **dashed draft** (not sent).
- 4 Tap word to edit; optional low-confidence underline.
- 5 User taps **Send** → message enters thread.
- 6 Discard returns to keyboard without sending.

Success metrics

Metric	Role
Voice prompt completion rate	North star (mic → Send)
Draft-to-send rate	Review step completes
Edit rate on drafts	Proves review is used
7-day repeat voice use	Habit
Typing share on 50+ char prompts	Guardrail

Launch & growth

- **Experiment:** 50/50 mobile, India + English, 2 weeks.
- **Kill rule:** draft-to-send below control and edit rate < 15% → stop.
- **Growth:** persistent mic; one first-run line; no badge spam; measure repeat not taps alone.

Non-goals (V1)

Advanced Voice Mode · new ASR programme · desktop/web · push-only “try voice” · auto-structure (phase 2 in prototype, labeled).
