

Voice Draft Mode

Milestone 3 · Prioritisation, metrics & growth · Arushi Srivastava · ChatGPT mobile composer

Prototype: <https://steel-main-21529943.figma.site>

Problem definition

Working professionals on ChatGPT mobile in India rarely use voice for work prompts. They know the mic exists and many have tried it once. They return to typing because **voice feels less safe**: words can become the prompt before they read and fix them.

- **Who:** Employed mobile users in India, 3+ sessions/week, email/summary/analysis prompts.
- **Business value:** Higher voice completion → longer sessions, stronger Plus retention.
- **User benefit:** Speak when busy; same control as typing before the model runs.
- **Why now:** WhatsApp and Gemini teach review/interrupt; Milestone 2 showed control, not discoverability, is the gap.

Validation (Milestone 2)

70%

Typing feels safer

50%

Want check-and-fix before send

80%

Use voice on WhatsApp

Survey: n=16 (10 working professionals). Three follow-up interviews + open-text. Directional sample.

Goals

North star: Voice prompt completion rate (mic session → user taps Send).

Metric	Why
Draft-to-send rate	Review step completes
Edit rate on drafts	Users fix transcript
7-day repeat voice use	Habit
Typing share on 50+ char prompts	Guardrail vs extra friction

Non-goals

- Advanced Voice Mode · new ASR/Hinglish programme · desktop/web
- Auto-organize/STAR (phase 2, labeled in prototype) · push-only “try voice” campaigns

Three directions & trade-offs

Direction	Impact	Effort (2 wk)	Decision
A. Voice Draft Mode	High — adds review	Medium	Build
B. Auto-organize / STAR guide	Medium	Medium–high	Later
C. Recognition / regional languages	High long-term	Very high	Out

User flow

1. Mic visible in composer.
2. Tap mic → speak → stop.
3. Transcript in **dashed draft** (not sent).
4. Tap word to edit; optional low-confidence underline.
5. User taps **Send** → message enters thread → model responds.
6. Discard returns to keyboard without sending.

Wireframes

Annotated screens in Figma Make prototype (link above): default composer, recording, draft state, inline edit, after Send. Phase 2 “Structure this” shown but disabled.

Key logic

- Never auto-send speech to the thread.
- Empty recognition → stay in draft with hint.
- First-run one line: “Voice stays as a draft until you send.”

Launch readiness

Milestone	Owner
PRD + experiment flag	PM
Draft composer UI	Mobile eng
QA: edit, send, discard	QA

Experiment: 50/50 mobile, India + English, 2 weeks. **Kill rule:** if draft-to-send < control completion and edit rate < 15%, stop.

Growth

- Persistent mic — no badge spam.
- One optional first-week tip.
- Measure repeat voice use, not mic taps alone.

Open questions

- Threshold for underlining low-confidence tokens?
- Require explicit Send vs power-user “send on stop”?
- Expand to students after professionals validate?
